

# Package: valueEQ5D (via r-universe)

September 5, 2024

**Type** Package

**Title** Scoring EQ-5d Descriptive System

**Version** 0.8

**Maintainer** Sheeja Manchira Krishnan <sheejamk@gmail.com>

**Depends** R (>= 3.6)

**Description** EQ-5D is a standard instrument

(<<https://euroqol.org/eq-5d-instruments/>>) that measures the quality of life often used in clinical and economic evaluations of health care technologies. Both adult versions of EQ-5D (EQ-5D-3L and EQ-5D-5L) contain a descriptive system and visual analog scale. The descriptive system measures the patient's health in 5 dimensions: the 5L versions has 5 levels and 3L version has 3 levels. The descriptive system scores are usually converted to index values using country specific values sets (that incorporates the country preferences). This package allows the calculation of both descriptive system scores to the index value scores. The value sets for EQ-5D-3L are from the references mentioned in the website

<<https://euroqol.org/eq-5d-instruments/eq-5d-3l-about/valuation/>>

The value sets for EQ-5D-3L for a total of 31 countries are used for the valuation (see the user guide for a complete list of references). The value sets for EQ-5D-5L are obtained from references mentioned in the

<<https://euroqol.org/eq-5d-instruments/eq-5d-5l-about/valuation-standard-value-sets/>>

and other sources. The value sets for EQ-5D-5L for a total of 17 countries are used for the valuation (see the user guide for a complete list of references). The package can also be used to map 5L scores to 3L index values for 10 countries: Denmark, France, Germany, Japan, Netherlands, Spain, Thailand, UK, USA, and Zimbabwe. The value set and method for mapping are obtained from Van Hout et al (2012) <[doi:10.1016/j.jval.2012.02.008](https://doi.org/10.1016/j.jval.2012.02.008)>.

As per NICE 2022 guidance, the mapping can also be done using Wailoo AJ et al (2017) <[doi.org/10.1016/j.jval.2016.11.006](https://doi.org/10.1016/j.jval.2016.11.006)>

Mapping is done for countries: China, England/UK, Germany,

Japan, Korea, Netherlands, and Spain.

**License** GNU General Public License

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.2.1

**Imports** testthat, dplyr, IPDFFileCheck, stringr, utils

**Suggests** knitr, rmarkdown, covr

**VignetteBuilder** knitr

**Config/testthat/edition** 3

**Repository** <https://sheejamk.r-universe.dev>

**RemoteUrl** <https://github.com/sheejamk/valueeq5d>

**RemoteRef** HEAD

**RemoteSha** 24a8cba859996fd8c61b38924c4362702c0dc1a8

`.correctImplausibleOrdering`  
*Function to correct implausible ordering in Australian valueset for EQ-5D-3L*

**Description**

Correcting the implausible ordering

**Usage**

`.correctImplausibleOrdering(scores)`

**Arguments**

scores                   , EQ-5D-3L scores as a number

**Value**

the value that read from the stored dataframe

**Examples**

`.correctImplausibleOrdering(11121)`

`check_column_exist`     *Function to check the given column exists*

**Description**

Function to check the given column exists

**Usage**

`check_column_exist(column_name, data)`

**Arguments**

column\_name     a column name  
data             data frame

**Value**

0 if success -1 if failure

**Examples**

```
check_column_exist("age", data.frame(
  age = rep(20, 4), sex = rep("male", 4),
  stringsAsFactors = FALSE
))
```

---

check\_scores\_3L      *Function to check the EQ-5D-3L scores*

---

**Description**

Function to check the EQ-5D-3L scores

**Usage**

```
check_scores_3L(dimen, dimen2 = NA, dimen3 = NA, dimen4 = NA, dimen5 = NA)
```

**Arguments**

dimen	a must input, response for EQ-5D-3L mobility or the 5 digit response, or the vector of responses, e.g. 11111, c(1, 1, 1, 1, 1) or 1
dimen2	response for EQ-5D-3L self care, or NA if the responses are given as dimensions
dimen3	response for EQ-5D-3L usual activities, or NA if the responses are given as dimensions
dimen4	response for EQ-5D-3L pain/discomfort, or NA if the responses are given as dimensions
dimen5	response for EQ-5D-3L anxiety/depression, or NA if the responses are given as dimensions

**Examples**

```
check_scores_3L(c(1, 2, 3, 3, 3))
check_scores_3L(1, 2, 3, 3, 3)
check_scores_3L(1, 2, 3, 2, 3)
check_scores_3L(12323)
```

---

check\_scores\_5L      *Function to check the EQ-5D-5L scores*

---

**Description**

Function to check the EQ-5D-5L scores

**Usage**

```
check_scores_5L(dimen, dimen2 = NA, dimen3 = NA, dimen4 = NA, dimen5 = NA)
```

**Arguments**

dimen	a must input, response for EQ-5D-3L mobility or the 5 digit response, or the vector of responses, e.g. 11111, c(1,1,1,1,1) or 1
dimen2	response for EQ-5D-5L self care, or NA if the responses are given as dimensions
dimen3	response for EQ-5D-5L usual activities, or NA if the responses are given as dimensions
dimen4	response for EQ-5D-5L pain/discomfort, or NA if the responses are given as dimensions
dimen5	response for EQ-5D-5L anxiety/depression, or NA if the responses are given as dimensions

**Examples**

```
check_scores_5L(c(1, 2, 3, 5, 3))
check_scores_5L(1, 2, 3, 4, 3)
check_scores_5L(12323)
```

---

convert\_number\_to\_digits  
*Function to convert a number to individual digits*

---

**Description**

Function to convert a number to individual digits

**Usage**

```
convert_number_to_digits(this_number)
```

**Arguments**

this_number	a number
-------------	----------

**Value**

digits

**Examples**

```
convert_number_to_digits(234)
```

---

descriptive\_stat\_data\_column

*Function to return descriptive statistics, sum, no of observations, mean, mode. median, range, standard deviation and standard error*

---

**Description**

Function to return descriptive statistics, sum, no of observations, mean, mode. median, range, standard deviation and standard error

**Usage**

```
descriptive_stat_data_column(column, column_name, nrcode = NA)
```

**Arguments**

column	column
column_name	the column name
nrcode	non response code corresponding to the column

**Value**

the descriptive statistics for success , -1 for failure

**Examples**

```
descriptive_stat_data_column(c(1, 2, 3, 4, NA), "scores", NA)
```

---

EQ5D3L\_indexvalues.df *EQ-5D-3L index values (for each set of response of 3L) for different countries*

---

**Description**

EQ-5D-3L index values (for each set of response of 3L) for different countries

**Usage**

EQ5D3L\_indexvalues.df

**Format**

A 243 by 38 dataframe

**Note**

: For testing purpose -not required by users

: VAS value for state 3333 was reported as -0.022, rather obtained -0.034 and needs to be checked with authors

: There were some implausible orderings and hard coded those only for Australian value sets

EQ5Dmap\_table3.df

*EQ-5D-5L mapping 3Lto 5L values*

---

### Description

EQ-5D-5L mapping 3Lto 5L values

### Usage

EQ5Dmap\_table3.df

### Format

A 31250 by 21 dataframe

### Source

Hernandez Alava et al (2017) <doi.org/10.1016/j.jval.2016.11.006>

---

EQ5Dmap\_table5.df      *EQ-5D-5L mapping 5Lto 3L values*

---

**Description**

EQ-5D-5L mapping 5Lto 3L values

**Usage**

EQ5Dmap\_table5.df

**Format**

A 31250 by 21 dataframe

**Source**

Hernandez Alava et al (2017) <doi.org/10.1016/j.jval.2016.11.006>

---

get\_colno\_existing\_colnames

*Function to return the column number for a given column name (from list of possible column names that may have used) in a data frame*

---

**Description**

Function to return the column number for a given column name (from list of possible column names that may have used) in a data frame

**Usage**

```
get_colno_existing_colnames(column_names, data)
```

**Arguments**

column\_names      column names in a data frame  
data                a data frame

**Value**

the column number

**Examples**

```
get_colno_existing_colnames(c("age"), data.frame(age = rep(20, 4),
gender = rep("male", 4)))
```

---

`get_column_no_colnames`*Function to return the column number for column name*

---

**Description**

Function to return the column number for column name

**Usage**

```
get_column_no_colnames(data, column_name)
```

**Arguments**

<code>data</code>	a data frame
<code>column_name</code>	column names of the data frame

**Value**

column number, if success -1, if failure

**Examples**

```
get_column_no_colnames(data.frame(age = rep(20, 4),  
sex = rep("male", 4)), "sex")
```

---

`get_frequency_table` *Function to return frequency table*

---

**Description**

Function to return frequency table

**Usage**

```
get_frequency_table(v)
```

**Arguments**

<code>v</code>	a vector
----------------	----------

**Value**

frequency table

**Examples**

```
get_frequency_table(c(1, 1, 1, 12, 2))
```

---

get_mode_for_vec	<i>Function to return mode</i>
------------------	--------------------------------

---

**Description**

Function to return mode

**Usage**

```
get_mode_for_vec(v)
```

**Arguments**

v                    a vector

**Value**

mode if success -1 for failure

**Examples**

```
get_mode_for_vec(c(1, 1, 2, 3))
```

---

map_5Lto3L	<i>Function to map EQ-5D-5L scores to EQ-5D-3L index values as per the specific country and group by gender and age</i>
------------	---

---

**Description**

Function to map EQ-5D-5L scores to EQ-5D-3L index values

**Usage**

```
map_5Lto3L(
  eq5dresponse_data,
  mobility,
  self_care,
  usual_activities,
  pain_discomfort,
  anxiety,
  country = "UK",
  method = "CW",
  groupby = NULL,
  agelimit = NULL
)
```

**Arguments**

eq5dresponse_data	the data containing eq5d5L responses
mobility	column name for EQ-5D-5L mobility
self_care	column name for response for EQ-5D-5L self care
usual_activities	column name for response for EQ-5D-5L usual activities
pain_discomfort	column name for response for EQ-5D-5L pain/discomfort
anxiety	column name for response for EQ-5D-5L anxiety/depression
country	country of interest, by default is UK, if groupby has to specify the country should be specified
method	CW cross walk
groupby	male or female -grouping by gender, default NULL
agelimit	vector of ages to show upper and lower limits

**Value**

index value if success, negative values for failure

**Examples**

```
map_5Lto3L(data.frame(
  mo = c(1), sc = c(4), ua = c(4), pd = c(3),
  ad = c(3)
), "mo", "sc", "ua", "pd", "ad")
```

---

map\_5Lto3L\_Ind

*Function to map EQ-5D-5L descriptive system to 3L index value*

---

**Description**

Function to map EQ-5D-5L descriptive system to 3L index value (ref: Van Hout et al 2012 and code inspired from <https://github.com/brechtdv/eq5d-mapping>)

**Usage**

```
map_5Lto3L_Ind(
  country = "UK",
  method = "CW",
  dimen,
  dimen2 = NA,
  dimen3 = NA,
  dimen4 = NA,
  dimen5 = NA
)
```

**Arguments**

country	default is "UK"
method	CW cross walk
dimen	response for EQ-5D-5L mobility or the 5 digit response, or the vector of responses, e.g. 11111, c(1,1,1,1,1) or 1
dimen2	response for EQ-5D-5L self care, or NA if the responses are given as dimen
dimen3	response for EQ-5D-5L usual activities, or NA if the responses are given as dimen
dimen4	response for EQ-5D-5L pain/discomfort, or NA if the responses are given as dimen
dimen5	response for EQ-5D-5L anxiety/depression, or NA if the responses are given as dimen

**Value**

index value of EQ-5D-3L, -1 if any error

**Examples**

```
map_5Lto3L_Ind("UK", "CW", 11125)
map_5Lto3L_Ind("UK", "CW", c(1, 1, 1, 2, 5))
map_5Lto3L_Ind("UK", "CW", 1, 1, 1, 2, 5)
```

---

map\_5Lto3L\_Ind\_NICE2022

*Function to map EQ-5D-5L descriptive system to 3L index value using Hernandez et al (2017) method and DSU's functional approach for NICE guidance 2022 countries are UK(England), Japan, Korea, Netherlands, China, Spain and Germany*

---

**Description**

Function to map EQ-5D-5L descriptive system to 3L index value (ref:Hernandez, M. and Pudney, S. (2017) and code inspired from <https://www.sheffield.ac.uk/nice-dsu/methods-development/mapping-eq-5d-5l-3l>)

**Usage**

```
map_5Lto3L_Ind_NICE2022(
  country,
  gender,
  dimen = NA,
  age = NA,
  agegroup = NA,
  dimen1 = NA,
```

```

    dimen2 = NA,
    dimen3 = NA,
    dimen4 = NA,
    dimen5 = NA
  )

```

### Arguments

country	specific country from the above country list
gender	gender
dimen	response for EQ-5D-5L mobility or the 5 digit response, or the vector of responses, e.g. 11111, c(1,1,1,1,1) or 1
age	age if given as exact age
agegroup	if age is not known age group should be given they are 16-35, 35-45, 45-55, 55-65, 65-100. 1-5
dimen1	response for EQ-5D-5L mobility, or NA if the responses are given as dimen
dimen2	response for EQ-5D-5L self care, or NA if the responses are given as dimen
dimen3	response for EQ-5D-5L usual activities, or NA if the responses are given as dimen
dimen4	response for EQ-5D-5L pain/discomfort, or NA if the responses are given as dimen
dimen5	response for EQ-5D-5L anxiety/depression, or NA if the responses are given as dimen

### Value

index value of EQ-5D-3L, -1 if any error

### Examples

```

map_5Lto3L_Ind_NICE2022("England", "female", 11121, 30)
map_5Lto3L_Ind_NICE2022("England", "female", NA, 30, NA, 1,2,3,4,5)

```

---

map\_5Lto3L\_NICE2022     *Function to map EQ-5D-5L scores to EQ-5D-3L index values as per the specific country and by gender and age or agegroup for a dataset*

---

### Description

Function to map EQ-5D-5L scores to EQ-5D-3L index values

**Usage**

```
map_5Lto3L_NICE2022(
  eq5dresponse_data,
  mobility,
  self_care,
  usual_activities,
  pain_discomfort,
  anxiety,
  country = "UK",
  gendercol,
  agecol,
  agegroupcol = NA,
  groupby = NA,
  agelimit = NA
)
```

**Arguments**

eq5dresponse_data	the data containing eq5d5L responses
mobility	column name for EQ-5D-5L mobility
self_care	column name for response for EQ-5D-5L self care
usual_activities	column name for response for EQ-5D-5L usual activities
pain_discomfort	column name for response for EQ-5D-5L pain/discomfort
anxiety	column name for response for EQ-5D-5L anxiety/depression
country	country of interest, by default is UK, if groupby has to specify the country should be specified
gendercol	name of gender column
agecol	name of age column
agegroupcol	name of age group column
groupby	male or female -grouping by gender, default NULL
agelimit	vector of ages to show upper and lower limits

**Value**

index value if success, negative values for failure

**Examples**

```
data <- data.frame(
  age = c(40, 20), sex = c("M", "F"),
  mo = c(1, 2), sc = c(1, 2), ua = c(3, 4), pd = c(3, 4), ad = c(3, 4))
map_5Lto3L_NICE2022(data, "mo", "sc", "ua", "pd", "ad", "UK", "sex", "age")
```

---

Probability\_matrix\_crosswalk.df  
*Probability matrix for the cross walk*

---

**Description**

Probability matrix for the cross walk

**Usage**

Probability\_matrix\_crosswalk.df

**Format**

A dataframe with 3124 rows and 243 columns

**Source**

[https://euroqol.org/wp-content/uploads/2018/02/EQ-5D-5L\\_Crosswalk\\_model\\_and\\_\\_methodology2.pdf](https://euroqol.org/wp-content/uploads/2018/02/EQ-5D-5L_Crosswalk_model_and__methodology2.pdf)  
Van Hout et al (2012) <doi: 10.1016/j.jval.2012.02.008>.

---

replace\_space\_underscore  
*Function to add an underscore for texts with spaces in between*

---

**Description**

Function to add an underscore for texts with spaces in between

**Usage**

replace\_space\_underscore(this\_string)

**Arguments**

this\_string     a string

**Value**

string where the spaces replaced by "\_"

**Examples**

replace\_space\_underscore("Sri Lanka")

---

subset\_gender\_age\_to\_group

*Function to check the gender column and age column subset based on the values in it have used) in a data frame*

---

### Description

Function to check the gender column and age column subset based on the values in it have used) in a data frame

### Usage

```
subset_gender_age_to_group(data, gender, agelimit)
```

### Arguments

data	a data frame
gender	groupby gender either male or female expected
agelimit	list of ages e.g. c(10,20)

### Value

the column number

### Examples

```
subset_gender_age_to_group(data.frame(age = rep(20, 4), gender = rep("male", 4)), "male", c(10, 70))
```

---

test\_data\_num\_norange *Function to check format of a numeric column when the values are not bounded*

---

### Description

Function to check format of a numeric column when the values are not bounded

### Usage

```
test_data_num_norange(vec, nrcode = NA)
```

### Arguments

vec	a column vector
nrcode	non response code corresponding to the column

**Value**

0, if success -1, if failure

**Examples**

```
test_data_num_norange(c(1, 2, 3, 4, -99), -99)
```

---

test\_file\_exist\_read *Function to throw error on invalid directory or file or if the file is not readable*

---

**Description**

Function to throw error on invalid directory or file or if the file is not readable

**Usage**

```
test_file_exist_read(filename)
```

**Arguments**

filename            name of a file or directory

**Value**

0 if success, non zero negative values if failure

**Examples**

```
test_file_exist_read(system.file("extdata", "blank.txt",
package = "valueEQ5D"))
```

---

value\_3L            *Function to value EQ-5D-3L columns to index values for any country and group by gender and age*

---

**Description**

Main function to value EQ-5D-5L descriptive system to 5L index values.

**Usage**

```
value_3L(
  eq5dresponse_data,
  mo,
  sc,
  ua,
  pd,
  ad,
  country,
  method,
  groupby,
  agelimit
)
```

**Arguments**

eq5dresponse_data	the data containing eq5d responses
mo	column name for EQ-5D-3L mobility
sc	column name for response for EQ-5D-3L self care
ua	column name for response for EQ-5D-3L usual activities
pd	column name for response for EQ-5D-3L pain/discomfort
ad	column name for response for EQ-5D-3L anxiety/depression
country	country of interest, by default is UK, if groupby has to specify the country should be specified
method	Either "TTO" or "VAS"
groupby	male or female -grouping by gender, default NULL
agelimit	vector of ages to show upper and lower limits

**Value**

the descriptive statistics of index values, frequency table and the modified data where the last column will be the index values `data<-data.frame(age=c(10,20),sex=c("M","F"),mo=c(1,2),sc=c(1,2),ua=c(3,4),pd=c(3,1),ad=c(3,1))` `value_3L(data, "mo", "sc","ua", "pd", "ad","UK","TTO",NULL,c(10,70))`

---

value\_3L\_Ind

*Function to value EQ-5D-3L scores for various countries*

---

**Description**

Function to value EQ-5D-3L scores for various countries

**Usage**

```
value_3L_Ind(
  country,
  method,
  dimen,
  dimen2 = NA,
  dimen3 = NA,
  dimen4 = NA,
  dimen5 = NA
)
```

**Arguments**

country	a country name from the list Belgium,Brazil,Canada,Chile, Denmark,Europe,Finland,France,Germany,Italy,NewZealand,Poland,Portugal,Slovenia,Spain,Taiwan,Thailand,UK,USA,and Zimbabwe
method	method name either TTO or VAS
dimen	a must input,response for EQ-5D-5L mobility or the 5 digit response, or the vector of responses, e.g. 11111, c(1,1,1,1,1) or 1
dimen2	response for EQ-5D-3L self care, or NA if the responses are given as dimen
dimen3	response for EQ-5D-3L usual activities,or NA if the responses are given as dimen
dimen4	response for EQ-5D-3L pain/discomfort, or NA if the responses are given as dimen
dimen5	response for EQ-5D-3L anxiety/depression, or NA if the responses are given as dimen

**Value**

index value based if success, negative values for failure

**Examples**

```
value_3L_Ind("UK", "TTO", 23131)
value_3L_Ind("Spain", "TTO", 2, 3, 1, 3, 1)
value_3L_Ind("Denmark", "VAS", c(1, 2, 3, 1, 3))
```

---

value_5L	<i>Function to value EQ-5D-5L scores for any country and group by gender and age</i>
----------	--

---

**Description**

Function to value EQ-5D-5L descriptive system to index value.

**Usage**

```
value_5L(  
  eq5dresponse_data,  
  mo,  
  sc,  
  ua,  
  pd,  
  ad,  
  country = "England",  
  groupby = NULL,  
  agelimit = NULL  
)
```

**Arguments**

eq5dresponse_data	the data containing eq5d responses
mo	column name for EQ-5D-5L mobility
sc	column name for response for EQ-5D-5L self care
ua	column name for response for EQ-5D-5L usual activities
pd	column name for response for EQ-5D-5L pain/discomfort
ad	column name for response for EQ-5D-5L anxiety/depression
country	country of interest, by default is England
groupby	male or female -grouping by gender, default NULL
agelimit	vector of ages to show upper and lower limits, default NULL

**Value**

index value if success, negative values for failure

**Examples**

```
data <- data.frame(  
  age = c(10, 20), sex = c("M", "F"),  
  mo = c(1, 2), sc = c(1, 2), ua = c(3, 4), pd = c(3, 4), ad = c(3, 4)  
)  
value_5L(data, "mo", "sc", "ua", "pd", "ad", "England", NULL, c(10, 70))
```

---

value\_5L\_Ind                      *Function to value EQ-5D-5L scores for various countries*

---

### Description

Function to value EQ-5D-5L scores for various countries

### Usage

```
value_5L_Ind(
  country,
  dimen,
  dimen2 = NA,
  dimen3 = NA,
  dimen4 = NA,
  dimen5 = NA
)
```

### Arguments

country	a country name from the list Canada,China,England, Germany,HongKong,Indonesia,Ireland,Japan,Korea, Poland,Spain,Taiwan,Thailand,and Uruguay
dimen	a must input,response for EQ-5D-5L mobility or the 5 digit response, or the vector of responses, e.g. 11111, c(1,1,1,1,1) or 1
dimen2	response for EQ-5D-5L self care, or NA if the responses are given as dimen
dimen3	response for EQ-5D-5L usual activities,or NA if the responses are given as dimen
dimen4	response for EQ-5D-5L pain/discomfort, or NA if the responses are given as dimen
dimen5	response for EQ-5D-5L anxiety/depression, or NA if the responses are given as dimen

### Value

index values if success, negative values if failure

### Examples

```
value_5L_Ind("England", 23434)
value_5L_Ind("China", 2, 3, 4, 3, 4)
value_5L_Ind("Poland", c(1, 2, 3, 4, 3))
```
